Final project design UI am using a graph structure to document friendships between friends. Each node represents a person while each edge represents the "mendship level" between them (1-100). For the purpose of the shortest path algorithm, smaller the "level" the closer the Priendship. Thus, we can use the snortest path algorithm to see how close a person is to other people in the friendship circle/graph. And we can use the minimum spanning tree to see the closest friendships that connects everyone together.

(2) create some tests for each functionally - Add nuw vertex ① Don't add vertex yet. check that vertex does not (2) Add vertex to graph. check that vertex does exist. - Add new eage O Don't add edge yet check that edge does not 2) Add edge to graph check that edge exists. -snortest path 1) test on empty graph · compare to expected 3 test on little more complex graph -> compart to expected

- minimum spanning tree (1) test on empty graph 2) test on simple graph · compare to expected 3) test on little more complex graph -> compart to expected my snortest Path Algorithm node dist parent Queue · start with 4 vectors node, distance, parent, Queve the size of the nodes list. -defaul+dist is 100000 cinf.) and default parent is nullptr.

· we check for any 15019 ted nodes (keeping count of them. · while the, we start from the current node and put its children in the queve. - if the distance from current node to first item in queve plus the current's distance is smaller than the distance for the item in queue, update dist and change parent to current. Add the greve node to node that has been checked -repeat for an items in queve - clear que le - new current is the next item in checked nodes. Repeat above process until all connected nodes are checked. - store info in a string & return

My Minimum spanning Tree Algonithm · take all the edges of graph and sort them from smallest to · take smallest edge, and to MST edges vector · keep taking the next smallest edge, only add to MST if the nut edge doesn't create a cycle.
